The Safety of Home Birth

The evidence is overwhelming – planned home birth is safe for healthy women

“Recognizing the evidence that births to healthy mothers, who are not considered at medical risk after comprehensive screening by trained professionals, can occur safely in various settings, including out-of-hospital birth centers and homes. ...Therefore, APHA supports efforts to increase access to out-of-hospital maternity care services...”

“Several methodologically sound observational studies have compared the outcomes of planned home-births (irrespective of the eventual place of birth) with planned hospital-births for women with similar characteristics. A meta-analysis of these studies showed no maternal mortality, and no statistically significant differences in perinatal mortality risk in either direction.”

“It is safe to say that a woman should give birth in a place where feels is safe, and at the most peripheral level at which appropriate care is feasible and safe. For a low-risk pregnant woman this can be at home, at a small maternity clinic or birth centre, in town or perhaps at the maternity unit of a larger hospital. However, it must be a place where all the attention and care are focused on her needs and safety, as close to home and her own culture as possible.

“Excellent outcomes with much lower intervention rates are achieved at home births. This may be because the overuse of interventions in hospital births introduces risks or the home environment promotes problem-free labors.”

“This study supports previous research indicating that planned home birth with qualified care providers can be a safe alternative for healthy lower risk women.”
